

Details about Climate Change Action Plan

Intesa Sanpaolo Group CO₂ emissions are divided, according to the classification proposed by the international standard GHG Protocol, into *Scope1*, *Scope2* and *Scope3*. The division in scope reflects the degree of control that the organisation has on its own emissions.

All the direct emissions of greenhouse gases produced by company property fall within *Scope1*. The Intesa Sanpaolo Group takes into consideration the emissions produced by independent gas boilers and by the company fleet.

Scope2 market based includes Intesa Sanpaolo indirect emissions, on which it has no direct control, such as the purchased electricity and emissions from the centralized heating systems.

Scope3 includes all the emissions that Intesa Sanpaolo does not control directly, even if linked to its core business, but has decided to report with a view to transparency.

Long term target table – details

*The targets are net of the change in emission factors.

**Location-based: for purchased electricity, *Scope2* data consider the national transformation factors. The location based method highlights the actual emissions reduction deriving from energy efficiency without considering the positive contribution resulting from the purchasing of certified renewable energy (Market-based).

All data refer to the Climate Change Action Plan's perimeter and therefore are not comparable with those reported in the Consolidate Non-financial Statement (CCAP perimeter= "% of emissions in scope" in base year, 2012).
